

Definition of Done

Student Name: Jonathan Fong

Date: April 5 2026

Project: AstraNotes

Part 2: Definition of Done (DoD)

The Definition of Done is the quality gate every AstraNotes task, feature, or artifact must clear before it is considered complete.

2.1 DoD Checklist

1. The item must tie to a specific requirement, charter constraint, sprint target, or approved backlog task.
2. I must be able to walk through the purpose, design logic, and major tradeoffs.
3. I should be willing to present it in review, justify the choices, and answer why it deserves to move into the next stage of AstraNotes.
4. Nothing in the work may conflict with the project's hard constraints
 - a. C++17 or later
 - b. RAII-based ownership
 - c. Smart pointers
 - d. MVC separation
 - e. Modular note/plugin extensibility
 - f. Testability through Google Test
5. The artifact cannot depend on invented tools, fuzzy abstractions, unsupported performance claims, or unclear ownership semantics.
6. Its structure, terminology, and logic are coherent enough that future work can build on it.
7. Completion requires some form of proof proportional to the task. Depending on the work, that may mean review of logic, interface inspection, requirement traceability, test-case definition, unit tests, or focused analysis.

8. If the item touches Secure Notes, EncryptionEngine behavior, persistence, plugin boundaries, or data flow, then privacy and security concerns must be addressed explicitly.
9. Any remaining weakness that could affect correctness, security, maintainability, or design integrity must either be fixed or recorded clearly.

2.2 Component-Specific DoD Extensions

The following extensions apply to specific AstraNotes work types:

<u>Work Type</u>	<u>Additional Done Criteria</u>
Header file (.h)	All public methods documented. Ownership semantics (unique_ptr vs shared_ptr) are explicit. No raw pointer ownership exposed in public API.
Architecture diagram	All MVC layers labeled. No module violates single-responsibility. Encryption layer is isolated from the View.
AI-generated code block	Hallucination scan passed. Memory safety gate passed. I can defend every non-trivial line.
Sprint deliverable	Mapped to a milestone. Reviewed against charter constraints. Prompt log updated.
Requirement clarification	Ambiguity resolved with documented rationale. No scope added without a matching charter requirement.

Reflection

This Definition of Done will help my AstraNotes project over the quarter by forcing me to treat AI-assisted work as something that must be verified, explained, and defended. Since AstraNotes has

strict technical constraints this DoD gives me a practical quality gate that prevents weak design decisions, vague requirements, and unsafe implementation choices from moving downstream. It also improves project discipline by requiring traceability, validation, and explicit handling of security-sensitive areas which will reduce confusion later and make the project easier to build, revise, and defend.
